

ABSTRACT OF THE DISCLOSURE

A versatile counting-meter is adapted for use in cycling, jogging and treading on a mini-step, for counting exact exercise amount. The counting-meter includes a casing in which an electronic circuit for a microprocessor and a swing-link counting means for pedometer function is provided. Control keys for selecting a desired function and an LCD for showing counting result are provided at a front surface of the casing. The casing is also provided at a rear surface with a connecting means including an elastic clip located between two parallel rails. The clip is normally pulled by a restoring force thereof to flatly locate in a recess between the rails, so that the casing could be attached to a mating member mounted on a bicycle handlebar or a mini-step by engaging the rails with channels on the mating member, or to a user's belt by clamping the elastic clip onto the belt.
